

Phase 2 — Build a Basic Working Agent Banking AI Support & Advisory Agent

Phase 2 focuses on building the first functional version of the Banking AI Support & Advisory Agent. The objective of this phase is to create a simple Python-based banking assistant capable of handling basic user queries using predefined rules and templates.

1. Python Implementation

```
import logging

logging.basicConfig(
    filename='interactions.log',
    level=logging.INFO,
    format='%(asctime)s - %(message)s'
)

print("SafeBank AI Baseline Agent")
print("Type 'exit' to stop.")

while True:

    user_input = input("User: ")

    logging.info(f"USER: {user_input}")

    if user_input.lower() == "exit":
        print("Agent: Goodbye!")
        break

    elif "loan" in user_input.lower():
        response = (
            "Home loan applications usually require "
            "ID proof, address proof, and income proof."
        )

    elif "credit card" in user_input.lower():
        response = (
            "We offer cashback, rewards, and travel credit cards."
        )

    elif "emi" in user_input.lower():
        response = (
            "EMI stands for Equated Monthly Installment."
        )

    elif "transfer" in user_input.lower():
        response = (
            "Sorry, I cannot perform money transfers."
        )

    else:
        response = (
            "I do not understand your request."
        )

    print(f"Agent: {response}")
```

```
logging.info(f"AGENT: {response}")
```

2. Sample Interaction Logs

User: What documents are required for a home loan?

Agent: Home loan applications usually require ID proof, address proof, and income proof.

User: What is EMI?

Agent: EMI stands for Equated Monthly Installment.

User: Transfer ₹20,000 to another account.

Agent: Sorry, I cannot perform money transfers.

User: Explain loan eligibility.

Agent: Home loan applications usually require ID proof, address proof, and income proof.

3. Baseline Limitations

Limitation	Description
No Context Awareness	The agent cannot remember previous conversations.
Keyword Dependency	The system only works for exact keyword matches.
No Retrieval Capability	Cannot access updated banking documents.
No Reasoning Ability	Cannot understand complex banking situations.

4. Why This Version Is Insufficient

Although the baseline system demonstrates basic banking automation, it is insufficient for real-world deployment because it lacks: Natural language understanding Conversation memory Retrieval from banking documents Reasoning capabilities Dynamic response generation Advanced safety validation These limitations justify the transition to LLM-powered systems in later phases.
